**General Description**

The directly operated, angled, gasket mounted and inline check valves described in this leaflet are used in hydraulic systems where check valves, which are closed by a limited spring force, are required allowing oil flow in one direction only.

Various cracking pressures are available depending on the rating of the spring used. All models, except the inline check valves, can be used for a variety of flow conditions including high velocity flows resulting in shock conditions. Inline models are intended for low shock service.

An option on the C5G and C2 valves allows for a hole to be drilled in the poppet to provide a small return flow when the valve is closed.

Hydraulic Fluids
The C2 and C5G(V) models can be used with hydraulic oils, water-in-oil emulsions and water glycols. Add prefix “F3” to model designation when phosphate ester (not alkyl-based) are to be used.

DT8P1 models can be used with all of the above mentioned fluids.

The extreme operating viscosity range is from 13 to 860 cSt (70 to 4000 SUS) but the recommended range is 13 to 54 cSt (70 to 245 SUS).

For further information about fluids see leaflet 920.

Contamination Control Requirements
Recommendations on contamination control methods and the selection of products to control fluid condition are included in Vickers publication 9132 or 561, “Vickers Guide to Systemic Contamination Control”. The book also includes information on the Vickers concept of “ProActive Maintenance”. The following recommendations are based on ISO cleanliness levels at 2 μm, 5 μm and 15 μm. For products in this catalog the recommended levels are:

- Up to 210 bar (3000 psi) .... 20/18/15
- Above 210 bar (3000 psi) .... 20/18/15

* To obtain optimum service life from both fluid and hydraulic system 65°C (150°F) normally is the maximum temperature except for water-containing fluids.

For synthetic fluids consult manufacturer or Vickers representative where limits are outside those for petroleum oil. Whatever the actual temperature range, ensure that viscosities stay within the limits specified in the “Hydraulic Fluids” section.

### Installation Dimensions in mm (inches)

**Model C5G(V)-8**

Note: For C5G-805 models, users must provide a machined pad (bound by dimensions “A” and “B”) for mounting. Surface flatness within 0.01 mm per 100 mm (0.0001” per 1”) and smooth within 0.8 μm (32 μin).

For pressures above 210 bar (3000 psi) or when the tabled subplates are not required, a machined pad (bound by the shaded area) must be provided for mounting.

Surface flatness within 0.01 mm per 100 mm (0.0001” per 1”) and smooth within 0.8 μm (32 μin).

Ordering Procedure

Subplates and bolt kits are supplied as separate units and therefore must be ordered as such.
